#### FACTORSATION OF POLYNOMIALS

# 🖙 FACTORISATION OF POLYNOMIALS 🧠

**<u>SS</u>** Homogeneous expression : An expression is said to be a homogeneous expression if all its terms are of same degree.

Ex: (i)  $ax^2 + hxy + by^2$ (ii)  $ax^2 + by^2 + cz^2 + fyz + gzx + hxy$ (iii)  $ax^3 + bx^2y$ 

**Note :** If a homogeneous expression can be split into product of two algebraic expressions, then each of them are homogeneous and the sum of their degrees is equal to the degree of the original expression.

<u>§§</u> <u>Cyclic expression :</u> An expression f(x, y, z) is said to be cyclic if f(x, y, z) = f(y, z, x)

**Ex**: f(x, y, z) = x(y + z) + y(z + x) + z(x + y)

**Note :** (i) If f(x, y, z) is cyclic, then f(x, y, z) = f(y, z, x) = f(z, x, y)

(ii) If f(x, y, z) is cyclic and we know one term, we can write the other two s.

terms.

**<u>Symmetrical function</u>**: A function is said to be symmetrical with respect to two variables if its value is unaltered by interchanging them.

**Ex** : f(a,b,c) is symmetrical about *a*, *b* if f(a,b,c) = f(b,a,c)

A function is said to be symmetric if it is symmetrical about each pair of its variables.

**Ex:** (1) 
$$E(a,b,c) = a^2 + b^2 + c^2 + ab + bc + ca$$

(2) 
$$E(a,b,c) = a(b-c)^2 + b(c-a)^2 + c(a-b)^2$$

**Factor theorem :** If f(x) is an algebraic expression and f(a) = 0, then (x-a) is a factor of f(x).

**Ex:**  $f(a) = a^2(b-c) + b^2(c-a) + c^2(a-b)$ If we take a = b, then

$$f(b) = b^{2}(b-c) + b^{2}(c-b) + c^{2}(b-b) = 0$$

 $\therefore$  (*a* – *b*) is a factor of *f*(*a*).

**Alternating function :** A function is said to be alternating with respect to its variables, when its sign but not its value is altered by interchanging any pair of them.

**VIII CLASS** 

Suppose E (a, b, c) is an alternating function.  
Then 
$$E(b,a,c) = -E(a,b,c)$$
  
Take  $a = b$   
 $E(b,b,c) = -E(b,b,c)$   
 $\Rightarrow 2E(b,b,c) = 0 \Rightarrow E(b,b,c) = 0$   
This means that  $E(a,b,c) = 0$  if  $a = b$   
 $\therefore (a - b)$  is a factor of  $E(a,b,c)$ .  
Similarly  $(b - c), (c - a)$  are also factors.  
**Ex**:  $E(a,b,c) = a(b^2 - c^2) + b(c^2 - a^2) + c(a^2 - b^2)$   
Notice that  $E$  is an alternating function  
 $E(b,b,c) = b(b^2 - c^2) + b(c^2 - b^2) + c(b^2 - b^2)$   
 $\therefore E = 0$  when  $a = b$  so that  $(a - b)$  is a factor of **E**  
Similarly  $(b - c), (c - a)$  are also factors  
Hence  $E(a,b,c) = k(a - b)(b - c)(c - a)$  as **E** is homogeneous of degree 3.  
 $k$  can be found by taking a suitable set of values for  $a, b, c$ .  
**EXAMPLE**  
**Notice**  
 $\sqrt{1.$  Factorize  $x^a + x^2 - 2ax + 1 - a^2$   
**Sol**:  $x^a + x^2 - 2ax + 1 - a^2$   
**sol**:  $x^a + x^2 - 2ax + 1 - a^2$   
**sol**:  $(x^2 + 4x + a)(x^2 + 1 - x - a)$   
 $= (x^2 + 1)^2 - (x + a)^2$   
 $= (x^2 + 1 + x + a)(x^2 + 1 - x - a)$   
 $= (x^2 + x + a + 1)(x^2 - x - a + 1)$   
 $\sqrt{2}$ . Factorize,  $(x^2 + 4x + 8)^2 + 3x(x^2 + 4x + 8) + 2x^2$   
**Sol**:  $(x^2 + 4x + 8)^2 + 3x(x^2 + 4x + 8) + 2x^2$   
 $= k^2 + 3xk + 2x^2$ , where  $k = x^2 + 4x + 8$   
 $= k^2 + xk + 2xk + 2x^2$   
 $= k(k + x) + 2x(k + x)$

$$= (ab + bc + ca)^{2} - (a^{2} + b^{2} + c^{2})(ab + bc + ca)$$

$$= (ab + bc + ca)[ab + bc + ca - a^{2} - b^{2} - c^{2}]$$

$$= -(ab + bc + ca)[a^{2} + b^{2} + c^{2} - ab - bc - ca]$$

## 1. Factorisation :

Process of writing the given expression as a product of its factors is called factorisation.

A factor which cannot be further expressed as product of factors is an irreducible factor.

\* The form of factorisation where all factors are primes is called product of prime = 1 x 72 = 2 x 36 = 3 x 24 = 4 x 18 factor form.

**Ex**:72

= 8 x 9

1,2,3,4,6,8,9,12,18,24,36,72 are the factors of 72.

\* If the given expression is of the form  $x^2 + (a+b)x + ab$ , then its factorisation is (x+a) (x+b)

## 2. Polynomial :

An expression is of the form  $f(x) = a_1 + a_1x + a_2x^2 + \dots + a_nx^n$ , where 'n' is non negative integer and  $a_0, a_1, a_2, \dots, a_n$  are complex numbers such that  $a_n^1 0$  is called a polynomial of degree 'n'.

**Ex:** 1.  $3x^4 - 2x^3 + 4x^2 - 5x + 6$ 

4 is the degree of polynomial.

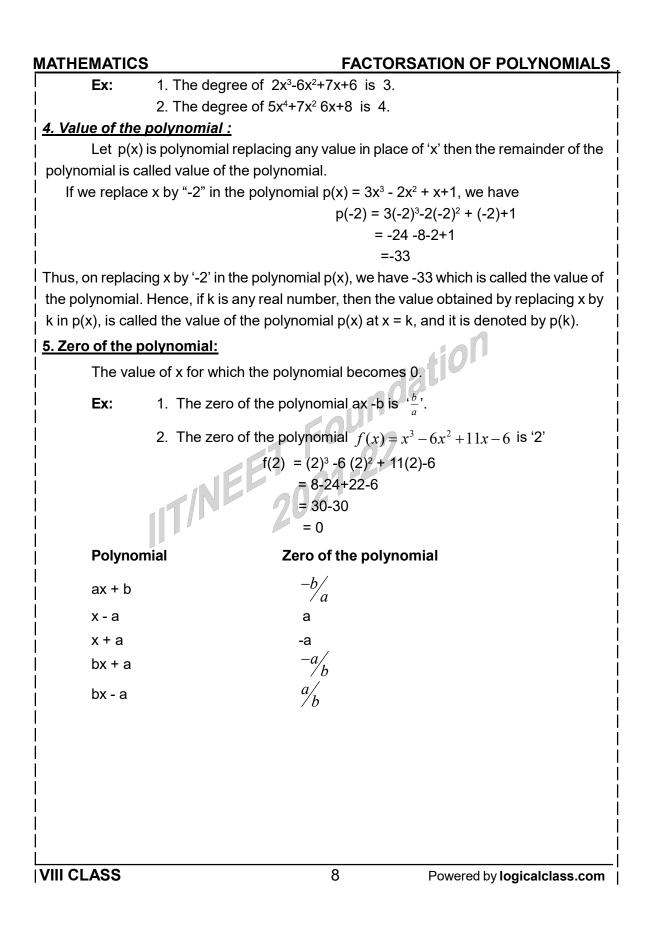

2.  $6x^6 + 5x^5 - 4x^4 + 3x^3 - 2x^2 + 6x - 7$ 

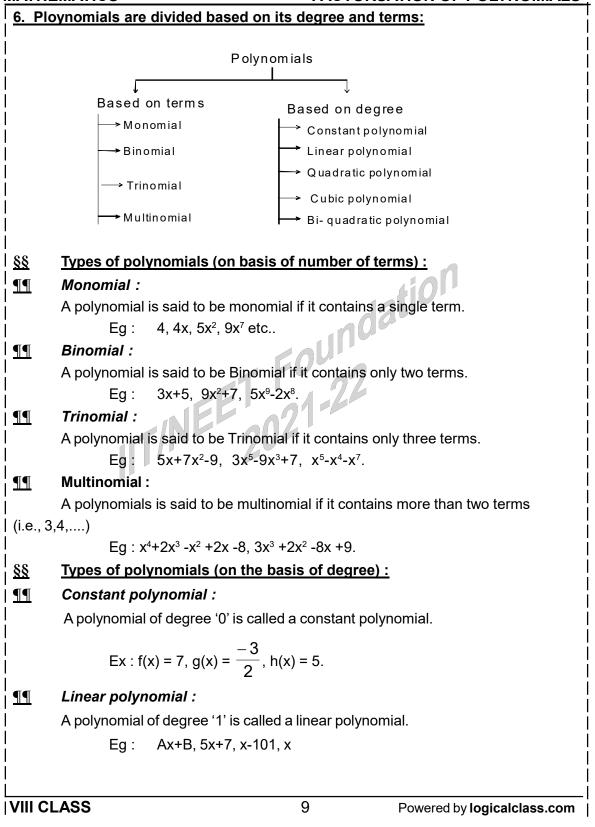

6 is the degree of polynomial.

## 3. Degree of the polynomial :

The highest power of x in the given polynomial is called the degree of that polynomial.

VIII CLASS

## **¶¶** Quadratic polynomial :

A polynomial of degree '2' is called a quadratic polynomial.

Eg: 
$$ax^2 + bx + c$$
,  $2x^2 - 5x$ ,  $x^2 - 6x + 2$ ,  $x^2$ 

## **<u>¶</u>** Cubic polynomial :

A polynomial of degree '3' is called a cubic polynomial.

$$\exists g: \quad ax^3 + bx^2 + cx + d, \ x^3 - 5x^2 + 7, \ x^3 - 8$$

## Image: Bi-quadratic polynomial :

A polynomial of degree '4' is called a Bi-quadratic polynomial.

$$\label{eq:Eg} \mathsf{Eg}: \qquad \mathsf{a} x^4 + \mathsf{b} x^3 + \mathsf{c} x^2 + \mathsf{d} x + \mathsf{e} \,, \ x^4 + \mathsf{5} x^3 + \mathsf{6} x - \mathsf{9} \,, \! x^2 \! y^2 \! + \! \mathsf{9} \,.$$

7. A complex number 'a' is said to be zero of the polynomial if f(a) = 0.

**8.** If all the terms of an algebraic expression are of the same degree then such expression are called as homogeneous expressions.

9. Standard forms of homogeneous expressions in two (or) more variables.

Variables	Degree	Standard form
x,y	1	ax+by
x,y	2	ax²+bxy+cy²
x,y	3	ax <sup>3</sup> +bx <sup>2</sup> y+cxy <sup>2</sup> +dy <sup>3</sup>
x,y	4	ax <sup>4</sup> +bx <sup>3</sup> y+cx <sup>2</sup> y <sup>2</sup> +dxy <sup>3</sup> +ey <sup>4</sup>
x,y,z	1	ax+by+cz
x,y,z	2	ax²+by²+cz²+dxy+eyz+fzx
x,y,z	3	ax <sup>3</sup> +by <sup>3</sup> +cz <sup>3</sup> +dx <sup>2</sup> y+exy <sup>2</sup> +fy <sup>2</sup> z+gyz <sup>2</sup> +hz <sup>2</sup> x+kzx <sup>2</sup>

**10.** A homogeneous expression is said to be complete, if it contains all the possible terms in it.

# 11. Alternating function :

If a function f of x, y, z ...... is transformed in to -f by the interchanging any two of the set x, y, z, .... then 'f' is called an alternating function of x, y, z.

## 12. Symmetric function :

A function which is unaltered by the interchange of any two of the variables which it contains is said to be symmetric with regard these variables i.e., an expression f(x,y) is said to be symmetric if f(x,y) = f(y,x)

**13.** An expression f(x,y,z) is said to be a cyclic expression if f(x,y,z) = f(y,z,x).

14. We use the symbols  $\Sigma$  (read as sigma) and  $\prod$  (pi) to write a cyclic expression.

VIII CLASS

### FACTORSATION OF POLYNOMIALS

 $\Sigma$  is used for **sum of terms** and  $\Pi$  is used for **product of terms**. i.e.,

 $\sum x(y+z) = x(y+z) + y(z+x) + z(x+y)$ 

 $\prod (a^2 + b^2) = (a^2 + b^2) (b^2 + c^2) (c^2 + a^2)$ 

## 15. Division algorithm :

If f(x),  $g(x) \neq 0$  are two polnomials then there exists polynomials q(x), r(x) uniquely such that  $f(x) = g(x) \cdot q(x) + r(x)$ .

Where r(x) = 0 (or) deg r(x) < deg g(x). The polynomial q(x) is called quotient and the polynomials r(x) is called remainder of f(x) when divided by g(x).

## 16. Remainder theorem :

If f(x) is a polynomial, then the remainder of f(x) when divided by (x-a) is f(a).

**17.** Let f(x), g(x) be two polynomials. g(x) is said to be factor of f(x), if there exists a polynomials q(x) such that f(x) = q(x).

## 18. Factor theorem :

If f(x) is a polynomial and f(a) = 0 then (x - a) is a factor of f(x).

**19.** a)  $x^n - y^n$  is divisible by x - y for every positive integer n.

b)  $x^n - y^n$  is divisible by x + y for every even positive integer n.

c)  $x^n + y^n$  is divisible by x + y for every odd positive integer n.

**20.** A quadratic polynomial can have at most 2 zeroes and a cubic polynomial can have at the most 3 zeroes.

**21.** If  $\alpha$  and  $\beta$  are the zeroes of the quadratic polynomial  $ax^2 + bx + c$ ,  $a \neq 0$ , then

$$\alpha + \beta = -\frac{b}{a}, \alpha\beta = \frac{c}{a}.$$

22.

If  $\alpha$  and  $\beta$  are the zeroes of the cubic polynomial  $ax^3 + bx^2 + cx + d$ ,  $a \neq 0$ , then

$$\alpha + \beta + \gamma = -\frac{b}{a},$$
  

$$\alpha\beta + \beta\gamma + \gamma\alpha = \frac{c}{a},$$
  
and 
$$\alpha\beta\gamma = -\frac{d}{a}.$$

List of formulae :

1)  $(a+b)^2 = a^2 + 2ab + b^2$ 2)  $(a-b)^2 = a^2 - 2ab + b^2$ 3)  $(a+b)(a-b) = a^2 - b^2$ 

VIII CLASS

	4)	$(a+b)^2-(a-b)^2=4ab$
Ì	5)	$(a + b)^2 + (a - b)^2 = 2(a^2 + b^2)$
	6)	$a^{2} + b^{2} = (a + b)^{2} - 2ab = (a - b)^{2} + 2ab$
	7)	$(a + b + c)^2 = a^2 + b^2 + c^2 + 2(ab + bc + ca)$
ļ	8)	$(a-b+c)^2 = a^2+b^2+c^2+2(-ab-bc+ca)$
	9)	$(a + b - c)^2 = a^2 + b^2 + c^2 + 2(ab - bc - ca)$
	10)	$(a+b)^3 = a^3 + b^3 + 3a^2b + 3ab^2 = a^3 + b^3 + 3ab(a+b)$
	11)	$(a-b)^3 = a^3 - b^3 - 3a^2b + 3ab^2 = a^3 - b^3 - 3ab(a-b)$
	12)	$a^{3} + b^{3} = (a + b)(a^{2} - ab + b^{2})$ (or) $(a + b)^{3} - 3ab(a + b)$
 	13)	$a^{3}-b^{3} = (a-b)(a^{2}+ab+b^{2}) \text{ or } (a-b)^{3}+3ab(a-b)$
	14)	$a^{3} + b^{3} + c^{3} - 3abc = (a + b + c)(a^{2} + b^{2} + c^{2} - ab - bc - ca)$
Ì	15)	If $a + b + c = 0$ or $a = b = c$ then $a^3 + b^3 + c^3 = 3abc$
	16)	$(a+b)^4 = a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4$
 	17)	$(a+b)^5 = a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5$
 	<u>Thero</u>	oms and its Proof :
Ψ	<u>Rema</u>	inder Theorem :
		x) be any polynomial of degree greater than or equal to one and let any real number. If p(x) is divided by the linear polynomial (x-a), then
		emainder is p(a).
Proof	: Let p	(x) be any polynomial with degreee greater than or equal to 1.
   	Furthe quotie	er suppose that when $p(x)$ is divided by a linear polynomial $g(x) = (x-a)$ , then ent is $q(x)$ and the remainder is r (x).
1		er words, $f(x)$ are two making arrivals quark that the degree of $r(x)$ degree of $r(x)$ and

### FACTORSATION OF POLYNOMIALS

p(x) = (x-a) .q(x) + r(x) $\therefore$  g (x) = (x - a) Since the degree of (x - a) is 1 and the degree of r(x) is less than the degree of (x - a)a). Degree of r(x) = 0, implies r(x) is a constant, say K. so, for every real value of x, r(x) = K. Therefore, p(x) = (x-a) q(x) + KIf x=a, then p(a) = (a-a)q(a) + K= 0+K = K P(a) = Kdation Then the remainder is P(a) Hence proved. Ψ Factor Theorem : If P(x) is a polynomial of degree  $n \ge 1$  and 'a' is any real number, then (i) x - a is a factor of (x), if p(a) - 0 (ii) and its converse "if (x-a) is a factor of a polynomial p(x) then p(a)=0. Let us see the simple proof of this theorem. Proof: By Remainder Theorem, p(x) = (x-a) q(x) + p(a)(i) Consider proposition (i) If p(a) = 0, then p(x) = (x-a) q(x) + 0. = (x-a) q(x)Which shows that (x-a) is a factor of p(x). Hence proved. (ii) Consider proposition (ii) since (x-a) is a factor of p(x) then p(x)=(x-a)q(x) for some polynomial q(x). p(a) = (a-a)q(a)= 0 Hence p(a)=0 when (x-a) is a factor of p(x)<u>§§</u> HCF and LCM of polynomials. **Divisor (Factor)** If a polynomial f(x) is a product of two polynomials g(x) and h(x). i.e., f(x) = g(x) X h(x) then g(x) and h(x) are called factors of f(x). VIII CLASS Powered by logicalclass.com

Eg:  $f(x) = x^2 - 5x + 6$ 

 $f(x) = x^2 - 5x + 6 = (x - 2)(x - 3)$ 

then (x-2) and (x-3) are factors of  $x^2-5x+6$ .

Note: If g(x) is a factor of f(x) then -g(x) is also a factor of f(x).

88 Highest common factor (HCF) or Greatest Common Divisor (GCD)

The HCF of two polynomials f(x) and g(x) is that common factor which has highest degree among all the factors and in which the co-efficient of highest degree term is positive.

Eg: Find the HCF of the polynomials  $150(6x^2+x-1)(x-3)^3$  and  $84(x-3)^2(8x^2+14x+5)$ 

Sol:

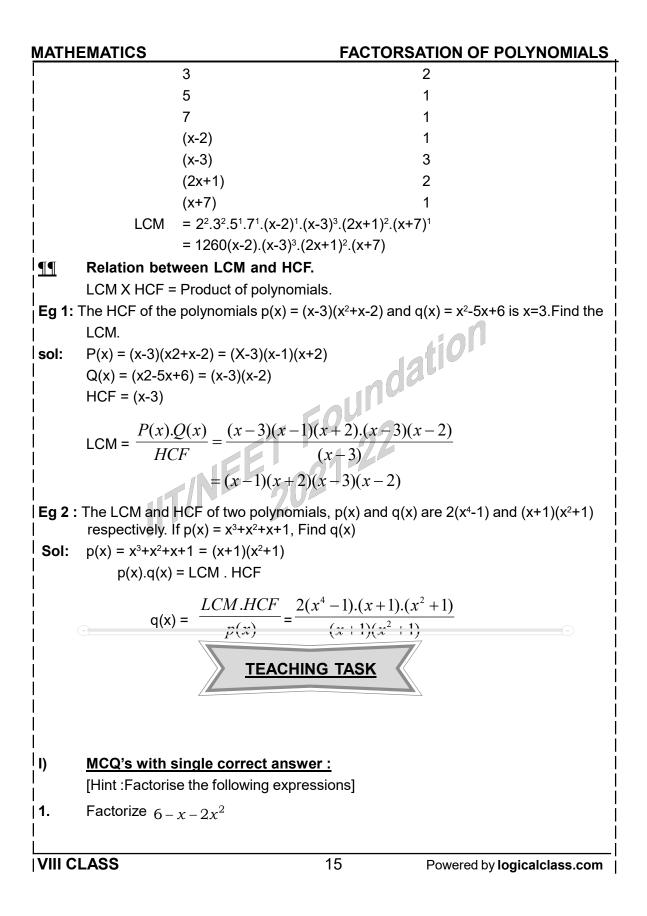

Lef $f(x) = 150(6x^2 + x - 1)(x - 3)^3$
and g(x) = 84(x-3) <sup>2</sup> (8x <sup>2</sup> +14x+5)
Now $f(x) = 150(6x^2+x-1)(x-3)^3$
$= 2.3.5^{2}(2x+1)(3x-1)(x-3)^{3}$
g(x)=84(x-3) <sup>2</sup> (8x <sup>2</sup> +14x+5)
$= 2^{2}.3.7(x-3)^{2}(2x+1)(4x+5)$
Common Factor Least Exponent
2
3
(2x+1) 1
(x-3) 2
HCF = $2^{1}.3^{1}.(2x+1)^{1}.(x-3)^{2}$
$= 6.(2x+1).(x-3)^2$

# <u>§§</u> <u>LCM of polynomials:</u>

The LCM of two or more polynomials is the polynomial of the lowest degree having smallest numerical co-efficient which is exactly divisible by the given polynomials and whose co-efficient of highest degree term has the same sign as the sign of the co-efficient of highest degree term in their product.

Eg: LCM of the polynomials  $90(x^2-5x+6)(2x+1)^2$  and  $140(x-3)^3(2x^2+15x+7)$ Let  $f(x) = 90(x^2-5x+6)(2x+1)^2$   $g(x) = 140(x-3)^3(2x^2+15x+7)$   $f(x) = 2.3^2.5.(x-2)(x-3)(2x+1)^2$   $g(x) = 2^2.5.7.(x-3)^3(2x+1)(x+7)$ <u>Factors of f(x) and g(x)</u> 2 <u>Greatest exponent</u> 2
