

7. DALTON'S LAW AND GRAHAMS LAW SOLUTIONS

TEACHING TASK

JEE MAINS LEVEL QUESTIONS

Grahams Law Of Diffusion

1. Under the same conditions the rates of diffusion of two gases are in the ratio 1 : 4. The ratio of their vapour densities is
- A) 2 : 1 B) 1 : 2 C) 16 : 1 D) 1 : 16

Answer:C

Solution:According to Graham's Law of Diffusion, the rate of diffusion (r) of a gas is inversely proportional to the square root of its vapour density (D) or molar mass

$$(M): \frac{r_1}{r_2} = \sqrt{\frac{D_2}{D_1}} = \sqrt{\frac{M_2}{M_1}}$$

$$\text{Given: } \frac{r_1}{r_2} = \frac{1}{4}$$

$$\text{Let's find the ratio of vapour densities (D): } \frac{1}{4} = \sqrt{\frac{D_2}{D_1}}$$

Square both sides:

$$\frac{1^2}{4} = \frac{D_2}{D_1}$$

$$\frac{1}{16} = \frac{D_2}{D_1}$$

$$\frac{D_1}{D_2} = \frac{16}{1}$$

2. Hydrogen diffuses six times faster than a gas 'X'. The molecular weight of 'X' is
- A) 36 B) 72 C) 28 D) 48

Answer:B

Solution: $\frac{r_{H_2}}{r_X} = \sqrt{\frac{M_X}{M_{H_2}}}$

Given: $r_{H_2} = 6.r_X \Rightarrow \frac{r_{H_2}}{r_X} = 6$
 $M_{H_2} = 2g / mol$

Substitute into Graham's Law: $6 = \sqrt{\frac{M_X}{2}}$

Square both sides: $36 = \frac{M_X}{2}$
 $M_X = 72$

3. Rate of diffusion of a gas is 720ml/minute. But the gas diffused for 20 seconds only. The volume of the gas diffused in ml is

- A) 240 B) 120 C) 60 D) 30

Answer:A

Solution: First, convert the rate to ml/second: $720ml / min = \frac{720}{60} = 12ml / sec$

Now, calculate the volume diffused in 20 seconds:

Volume=Rate×Time=12×20=240 ml

4. Assuming that at S.T.P. gas A has a density of 0.09gram per litre and gas B has a density of 1.43 gram per litre, the ratio between the rates of diffusion of A and B is

- A) 1 :16 B) 16:1 C) 2 :1 D) 4 : 1

Answer:D

Solution: $D_A = 0.09$ gram per litre, $D_B = 1.43$ gram per litre

$$\frac{r_A}{r_B} = \sqrt{\frac{D_B}{D_A}}$$

$$\frac{r_A}{r_B} = \sqrt{\frac{1.43}{0.09}}$$

$$\frac{r_A}{r_B} = \sqrt{15.88} \approx 4$$

5. Through a narrow apparatus 2 litres of H_2 diffuses in 2 hours under same conditions time required in hours for the diffusion of 1 litre of oxygen is

- A) 1 B) 2 C) 3 D) 4

Answer:D

Solution:From Graham's Law, the time of diffusion (t) is directly proportional to

the square root of the molar mass (M): $\frac{t_{O_2}}{t_{H_2}} = \sqrt{\frac{M_{O_2}}{M_{H_2}}}$

Given: $M_{H_2} = 2\text{gms}, M_{O_2} = 32\text{gms}$

$$t_{H_2} = 2\text{hours (for 2L)} \Rightarrow \text{Rate} = \frac{2L}{2h} = 1L/h$$

For 1 L of O_2 :

$$\frac{t_{O_2}}{1} = \sqrt{\frac{32}{2}}$$

$$t_{O_2} = \sqrt{16} = 4\text{hours}$$

6. Two grams of H_2 diffuses in 10 minutes. The weight of O_2 that can diffuse from the same container in the same time under similar conditions is

- A) 4 gm B) 0.5gm C) 6 gm D) 8 gm

Answer:B

Solution:From Graham's Law of Diffusion, the rate of diffusion (r) is inversely proportional to the square root of the molar mass (M):

$$\frac{r_{H_2}}{r_{O_2}} = \sqrt{\frac{M_{O_2}}{M_{H_2}}}$$

Given:

$M_{H_2} = 2\text{gms}, M_{O_2} = 32\text{gms}$

$$\frac{r_{H_2}}{r_{O_2}} = \sqrt{\frac{32}{2}} = 4$$

This means H_2 diffuses 4 times faster than O_2 .

Now, if 2 g of H_2 diffuses in 10 minutes, then the amount of O_2 diffusing in the same time is:

$$\text{Amount of } O_2 = \frac{\text{Amount of } H_2}{\text{Ratio}} = \frac{2}{4} = 0.5g$$

7. One litre of methane takes 20 minutes to diffuse out of a vessel. How long will it take to diffuse one litre of SO_2 through the vessel under the same conditions of temperature and pressure.

- A) 40 min. B) 24 min C) 20min D) 10min

Answer:A

Solution: From Graham's Law, the time of diffusion (t) is directly proportional to

the square root of the molar mass (M): $\frac{t_{SO_2}}{t_{CH_4}} = \sqrt{\frac{M_{SO_2}}{M_{CH_4}}}$

Given: $M_{CH_4} = 16g/mol, M_{SO_2} = 64g/mol, t_{CH_4} = 20 \text{ min}$

$$\frac{t_{SO_2}}{20} = \sqrt{\frac{64}{16}} \Rightarrow \frac{t_{SO_2}}{20} = \sqrt{4} \Rightarrow \frac{t_{SO_2}}{20} = 2 \Rightarrow t_{SO_2} = 40 \text{ min}$$

8. The density of gas "A" is four times that of another gas "B". If the molecular weight of A is M, the molecular weight of B will be

- A) 2M B) 4M C) $\frac{M}{4}$ D) $\frac{M}{2}$

Answer:C

Solution: $D_A = 4D, D_B = D, M_A = M, M_B = ?$

$$\sqrt{\frac{M_A}{M_B}} = \sqrt{\frac{D_A}{D_B}}$$

$$\sqrt{\frac{M}{M_B}} = \sqrt{\frac{4D}{D}}$$

$$\sqrt{\frac{M}{M_B}} = \sqrt{4}$$

$$\frac{M}{M_B} = 4 \Rightarrow M_B = \frac{M}{4}$$

9. A vessel contains equal number of moles of Helium and Methane. Through a small orifice the half of gas effused out. The ratio of the number of mole of Helium and methane remaining in the vessel is

- A) 2 : 1 B) 1 : 2 C) 1 : 4 D) 4 : 1

Answer:B

Solution:From Graham's Law, the effusion rate (r) is inversely proportional to the

square root of the molar mass (M): $\frac{r_{He}}{r_{CH_4}} = \sqrt{\frac{M_{CH_4}}{M_{He}}} = \sqrt{\frac{16}{4}} = 2$

This means Helium effuses twice as fast as Methane.

Let the initial moles of each gas be 1 mol.

Total gas = 2 mol.

Half effuses out = 1 mol.

Since He effuses twice as fast as CH₄, the ratio of effused moles is 2:1.

Thus:He effused: $\frac{2}{3} \times 1 = \frac{2}{3}$

CH₄ effused: $\frac{1}{3} \times 1 = \frac{1}{3}$

Remaining moles:He: $1 - \frac{2}{3} = \frac{1}{3}$

CH₄: $1 - \frac{1}{3} = \frac{2}{3}$

Thus, the ratio is 1 : 2.

10. A uniform glass tube of 100cm length is connected to a bulb containing Hydrogen at one end and another bulb containing Oxygen at the other end at the same temperature and pressure. The two gases meet for the first time at the following distance from the oxygen end.

- A) 80cm B) 50cm C) 20cm D) 6.66cm

Answer:C

Soluton:This problem involves diffusion of gases in a tube. Since the tube is uniform and the gases are at the same temperature and pressure, they will diffuse towards each other at rates governed by Graham's Law of Diffusion.

Step 1: Understand Graham's Law

Graham's Law states that the rate of diffusion (r) of a gas is inversely proportional

to the square root of its molar mass (M): $\frac{r_{H_2}}{r_{O_2}} = \sqrt{\frac{M_{O_2}}{M_{H_2}}}$

$$M_{H_2} = 2 \text{ gms}, M_{O_2} = 32 \text{ gms}$$

$$\frac{r_{H_2}}{r_{O_2}} = \sqrt{\frac{32}{2}} = 4$$

This means Hydrogen diffuses 4 times faster than Oxygen.

Step 3: Relate Diffusion Rates to Distances Covered

Let: x = distance covered by Oxygen (O_2) from its end before meeting Hydrogen.

$100 - x$ = distance covered by Hydrogen (H_2) from its end before meeting Oxygen.

Since time taken to meet is the same for both gases, and distance = rate \times time, we have:

$$\frac{100 - x}{x} = \frac{r_{H_2}}{r_{O_2}} = 4$$

$$100 - x = 4x \Rightarrow 100 = 5x \Rightarrow x = 100 / 5 = 20 \text{ cm}$$

Oxygen travels 20 cm from its end before meeting Hydrogen.

Hydrogen travels 80 cm from its end before meeting Oxygen.

11. One litre of a gaseous mixture of two gases effuses in 311 seconds while 2 litres of oxygen takes 20 minutes. The vapour density of gaseous mixture containing CH_4 and H_2 is

(A) 4

(B) 4.3

(C) 3.4

(D) 5

Answer: B

Solution: Given Data

Volume of mixture effused = 1 L, Time taken = 311 s

Volume of O_2 effused = 2 L, Time taken = 20 min = 1200 s

The rate of effusion (r) is given by: $r = \frac{\text{volume effused}}{\text{time taken}}$

$$\text{Rate of mixture: } r_{\text{mix}} = \frac{1L}{311s}$$

$$\text{Rate of O}_2: r_{O_2} = \frac{2L}{1200s} = \frac{1L}{600s}$$

$$\text{Graham's Law states: } \frac{r_{mix}}{r_{O_2}} = \sqrt{\frac{M_{O_2}}{M_{mix}}}$$

$$\frac{1}{\frac{311}{1}} = \sqrt{\frac{32}{M_{mix}}}$$

$$\frac{600^2}{311^2} = \frac{32}{M_{mix}}$$

$$M_{mix} = 32 \times \left(\frac{311}{600}\right)^2 \approx 8.58$$

Relate Molar Mass to Vapour Density

$$\text{Vapour Density (VD)} = \frac{M_{mix}}{2} = \frac{8.58}{2} \approx 4.3$$

12. Pure O₂ diffuses through an aperture in 224 second, whereas mixture of O₂ and another gas containing 80% O₂ diffuses from the same in 234 second. The molecular mass of gas will be

- (A) 51.5 (B) 48.6 (C) 55 (D) 46.6

Answer:D

Solution: Time for pure O₂ = 224 sec

Time for mixture (t_{mix}) = 234 s

Mixture composition: 80% O₂, 20% unknown gas (X)

The average molar mass (M_{mix}) of the mixture is:

$$M_{mix} = 0.8 \times M_{O_2} + 0.2 \times M_X$$

$$M_{mix} = 0.8 \times 32 + 0.2 \times M_X = 25.6 + 0.2 \times M_X$$

Graham's Law relates time and molar mass: $\frac{t_{mix}}{t_{O_2}} = \sqrt{\frac{M_{mix}}{M_{O_2}}}$

$$\frac{234}{224} = \sqrt{\frac{M_{mix}}{32}}$$

$$\frac{234^2}{224} = \frac{M_{mix}}{32}$$

$$M_{mix} = 32 \times \frac{234^2}{224} \approx 34.91 \text{ g/mol}$$

Solve for M_x :

$$34.91 = 25.6 + 0.2 \times M_x$$

$$M_x = 46.55 \text{ g/mol}$$

13. A straight glass tube has 2 inlets X & Y at the two ends of 200 cm long tube. HCl gas through inlet X and NH_3 gas through inlet Y are allowed to enter in the tube at the same time and under the identical conditions. At a point P inside the tube both the gases meet first. The distance of point P from X is :

- (A) 118.9 cm (B) 81.1 cm (C) 91.1 cm (D) 108.9 cm

Answer: B

Solution: Length of tube (L) = 200 cm

Gases: HCl enters from X, NH_3 enters from Y (opposite ends).

Objective: Find the distance from X where HCl and NH_3 meet for the first time.

Graham's Law states that the rate of diffusion (r) of a gas is inversely proportional

to the square root of its molar mass (M): $\frac{r_{\text{NH}_3}}{r_{\text{HCl}}} = \sqrt{\frac{M_{\text{HCl}}}{M_{\text{NH}_3}}} = \sqrt{\frac{36.5}{17}} \approx \sqrt{2.147} \approx 1.465$

This means NH_3 diffuses ~1.465 times faster than HCl.

d = distance covered by HCl from X before meeting NH_3 .

200-d = distance covered by NH_3 from Y before meeting HCl.

Since time taken to meet is the same, and distance = rate × time, we

$$\frac{200-d}{d} = \frac{r_{\text{NH}_3}}{r_{\text{HCl}}} = 1.465$$

have: $200-d = 1.465d$

$$d = \frac{200}{2.465} \approx 81.1 \text{ cm}$$

The distance of point P from X is 81.1 cm.

14. Two flasks of equal volume are connected by a narrow tube (of negligible volume) all at 27° C and contain 0.70 moles of H₂ at 0.5 atm. One of the flask is then immersed into a bath kept at 127° C, while the other remains at 27° C. The number of moles of H₂ in flask 1 and flask 2 are :

(A) Moles in flask 1 = 0.4, Moles in flask 2 = 0.3

(B) Moles in flask 1 = 0.2, Moles in flask 2 = 0.3

(C) Moles in flask 1 = 0.3, Moles in flask 2 = 0.2

(D) Moles in flask 1 = 0.4, Moles in flask 2 = 0.2

Answer:A

Solution:Step 1: Understand the Initial Conditions

Initial temperature (T₁) = 27° C = 300 K

Total moles of H₂ (n_{total}) = 0.70 moles

Pressure (P) = 0.5 atm (same in both flasks initially)

Volume of each flask = V (equal volumes)

Step 2: After Heating One Flask

Flask 1: Remains at T₁ = 300 K

Flask 2: Heated to T₂ = 127° C = 400 K

Since the flasks are connected, the pressure will equalize in both flasks at equilibrium.

Step 3: Let Final Moles be n₁ (Flask 1) and n₂ (Flask 2)

At equilibrium:n₁+n₂=0.70(Total moles conserved)

The pressure in both flasks is the same, so:P₁=P₂

Using the Ideal Gas Law (PV = nRT) for both flasks:

$$\frac{n_1RT_1}{V} = \frac{n_2RT_2}{V}$$

$$n_1T_1 = n_2T_2$$

$$\frac{n_1}{n_2} = \frac{4}{3}$$

$$n_1 = \frac{4}{3}n_2$$

$$\frac{4}{3}n_1 + n_2 = 0.70$$

$$n_2 = 0.30 \text{ moles}$$

Substitute into total moles:

$$n_1 = \frac{4}{3} \times 0.30 = 0.40 \text{ moles}$$

15. A teacher enters a classroom from front door while a student from back door. There are 13 equidistant rows of benches in the classroom. The teacher releases N_2O , the laughing gas, from the first bench while the student releases the weeping gas ($\text{C}_6\text{H}_{11}\text{OBr}$) from the last bench. At which row will the students start laughing and weeping simultaneously

(A) 7

(B) 10

(C) 9

(D) 8

Answer: C

Solution: Step 1: Understand the Problem

Total rows = 13 (bench 1 is front, bench 13 is back).

N_2O (laughing gas) starts diffusing from bench 1.

$\text{C}_6\text{H}_{11}\text{OBr}$ (weeping gas) starts diffusing from bench 13.

Objective: Find the row where both gases meet simultaneously.

Step 2: Apply Graham's Law of Diffusion

The rate of diffusion (r) is inversely proportional to the square root of molar mass

$$\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$$

$$(M): \frac{r_{\text{N}_2\text{O}}}{r_{\text{C}_6\text{H}_{11}\text{OBr}}} = \sqrt{\frac{M_{\text{C}_6\text{H}_{11}\text{OBr}}}{M_{\text{N}_2\text{O}}}} = \sqrt{\frac{179}{44}} \approx 2.02$$

This means N_2O diffuses ~2.02 times faster than $\text{C}_6\text{H}_{11}\text{OBr}$.

Step 4: Relate Distances Covered

Let: x = distance (rows) covered by N_2O from bench 1.

$13-x$ = distance (rows) covered by $\text{C}_6\text{H}_{11}\text{OBr}$ from bench 13.

Since time taken to meet is the same, and distance = rate \times time, we have:

$$\frac{x}{13-x} = \frac{r_{N_2O}}{r_{C_6H_{11}OBr}} = 2.02$$

$$x = 2.02(13-x)$$

$$3.02x = 26.26$$

$$x \approx 8.7$$

16. Two gases A and B having the same volume diffuse through a porous partition in 20 and 10s respectively. The molecular mass of A is 49 u. Molecular mass of B will be [AIPMT 2011]

- (A) 12.25 u (B) 6.50 u (C) 25.00 u (D) 50.00 u

Answer:A

Solution:Step 1: Understand Graham's Law

The time of diffusion (t) is directly proportional to the square root of molar mass (M):

$$\frac{t_A}{t_B} = \sqrt{\frac{M_A}{M_B}}$$

$$t_A = 20s, t_B = 10s, M_A = 49u$$

$$\frac{20}{10} = \sqrt{\frac{49}{M_B}}$$

$$M_B = \frac{49}{4} = 12.25u$$

17. Equal moles of hydrogen and oxygen gases are placed in container with a pin-hole through which both can escape. What fraction of the oxygen escapes in the time required for one-half of the hydrogen to escape?

[NEET 2016, Phase I]

- (A) 1/4 (B) 3/8 (C) 1/2 (D) 1/8

Answer:D

Solution:The rate of effusion (r) is inversely proportional to the square root of molar mass (M):

$$M_{H_2} = 2\text{gms}, M_{O_2} = 32\text{gms}$$

$$\frac{r_{H_2}}{r_{O_2}} = \sqrt{\frac{32}{2}} = 4$$

This means H₂ effuses 4 times faster than O₂.

Step 2: Relate Fractions Escaped

Let: Time taken for half of H₂ to escape = t.

Fraction of O₂ escaped in the same time = f.

Since effusion is proportional to rate:

$$\frac{f_{O_2}}{f_{H_2}} = \frac{r_{O_2}}{r_{H_2}} = \frac{1}{4}$$

$$f_{H_2} = \frac{1}{2}$$

$$f_{O_2} = \frac{1}{4} \times \frac{1}{2} = \frac{1}{8}$$

The fraction of oxygen escaped is 1/8.

Dalton's Law Of Partial Pressure

18. Equal masses of SO₂ and O₂ are kept in a vessel at 27^o C. The total pressure of the mixture is 2.1 atm. The partial pressure of SO₂ is

A) 1.4 atm

B) 7 atm

C) 0.7atm

D) 14 atm

Answer:C

Solution: Step 1: Understand the Given Data

Equal masses of SO₂ and O₂ are present.

Total pressure (P_{total}) = 2.1 atm

Temperature = 27^oC = 300 K (not directly needed for partial pressure calculation).

Step 2: Calculate Moles of Each Gas

Let the mass of each gas be m grams.

Molar mass of SO_2 (M_1) = 64 g/mol

Molar mass of O_2 (M_2) = 32 g/mol

Number of moles: $n_{\text{SO}_2} = \frac{m}{64}$, $n_{\text{O}_2} = \frac{m}{32}$

Total moles: $n_{\text{total}} = \frac{m}{64} + \frac{m}{32} = \frac{3m}{64}$

Mole fraction of SO_2 : $X_{\text{SO}_2} = \frac{n_{\text{SO}_2}}{n_{\text{total}}} = \frac{\frac{m}{64}}{\frac{3m}{64}} = \frac{1}{3}$

Partial pressure is given by: $P_{\text{SO}_2} = X_{\text{SO}_2} \times P_{\text{total}} = \frac{1}{3} \times 2.1 = 0.7 \text{ atm}$

19. A gas mixture contains Nitrogen and Helium in 7 : 4 ratio by weight. The pressure of the mixture is 760mm. The partial pressure of Nitrogen is

A) 0.2 atm

B) 0.8 atm

C) 0.5 atm

D) 0.4atm

Answer:A

Solution: Step 1: Understand the Given Data

Weight ratio of N_2 : He = 7 : 4

Total pressure (P_{total}) = 760 mm = 1 atm

Step 2: Calculate Moles of Each Gas

Let the masses be: Mass of N_2 = 7 g, Mass of He = 4 g

Moles of each gas: $n_{\text{N}_2} = \frac{7}{28} = 0.25 \text{ mol}$, $n_{\text{He}} = \frac{4}{4} = 1 \text{ mol}$

$n_{\text{total}} = 0.25 + 1 = 1.25 \text{ mol}$

Mole fraction of N_2 : $X_{\text{N}_2} = \frac{0.25}{1.25} = 0.2$

Partial pressure is given by: $P_{\text{N}_2} = X_{\text{N}_2} \times P_{\text{total}} = 0.2 \times 1 = 0.2 \text{ atm}$

20. A 200cc flask contains oxygen at 200mm pressure and a 300 cc flask contains Nitrogen at 100mm pressure. The two flasks are connected so that each gas occupies the combined volume. The total pressure of the mixture in mm is

- A) 80 B) 60 C) 140 D) 300

Answer:C

Solution:Oxygen flask: 200 cc at 200 mm Hg

Nitrogen flask: 300 cc at 100 mm Hg

Combined volume after connection: 200 + 300 = 500 cc

Step 1: Calculate new partial pressures using Boyle's Law ($P_1V_1 = P_2V_2$)

For Oxygen:

$$P_2 = (200 \text{ mm} \times 200 \text{ cc}) / 500 \text{ cc} = 80 \text{ mm Hg}$$

For Nitrogen:

$$P_2 = (100 \text{ mm} \times 300 \text{ cc}) / 500 \text{ cc} = 60 \text{ mm Hg}$$

Step 2: Calculate total pressure

$$\begin{aligned} \text{Total pressure} &= \text{Partial pressure O}_2 + \text{Partial pressure N}_2 \\ &= 80 \text{ mm} + 60 \text{ mm} = 140 \text{ mm Hg} \end{aligned}$$

21. In a ten litre vessel, the total pressure of a gaseous mixture containing H₂, N₂ and CO₂ is 9.8 atm. The partial pressures of H₂ and N₂ are 3.7 and 4.2 atm, respectively. The partial pressure of CO₂ is

- A) 1.9 atm B) 0.19 atm C) 2.4 atm D)0.019 atm

Answer:A

Solution:Given:Total pressure (P_{total}) = 9.8 atm

Partial pressure H₂ = 3.7 atm

Partial pressure N₂ = 4.2 atm

Step 1: Apply Dalton's Law of Partial Pressures

$$P_{\text{total}} = P_{\text{H}_2} + P_{\text{N}_2} + P_{\text{CO}_2}$$

Step 2: Solve for P_{CO_2}

$$9.8 \text{ atm} = 3.7 \text{ atm} + 4.2 \text{ atm} + P_{\text{CO}_2}$$

$$P_{\text{CO}_2} = 9.8 - (3.7 + 4.2) = 1.9 \text{ atm}$$

22. 3 grams of H_2 and 24 grams of O_2 are present in a gaseous mixture at constant temperature and _____ pressure. The partial pressure of H_2 is

A) $\frac{1}{3}$ of total pressure B) $\frac{2}{3}$ of total pressure C) $\frac{3}{2}$ of total pressure D) $\frac{1}{2}$ of total pressure

Answer: B

Solution: Given: 3 grams of H_2 , 24 grams of O_2

Constant temperature and pressure

$$\text{Moles of } \text{H}_2 = \text{mass/molar mass} = 3\text{g}/2\text{g/mol} = 1.5 \text{ mol}$$

$$\text{Moles of } \text{O}_2 = 24\text{g}/32\text{g/mol} = 0.75 \text{ mol}$$

$$\text{Total moles} = 1.5 + 0.75 = 2.25 \text{ mol}$$

$$\text{Mole fraction of } \text{H}_2 (X_{\text{H}_2}) = \text{moles of } \text{H}_2 / \text{total moles} = 1.5/2.25 = 2/3$$

$$\text{Partial pressure of } \text{H}_2 (P_{\text{H}_2}) = \text{Mole fraction} \times \text{Total pressure} = (2/3)P_{\text{total}}$$

23. A gaseous mixture was prepared by taking equal moles of CO and N_2 . If the total pressure of the mixture was found 1 atm, the partial pressure of the nitrogen (N_2) in the mixture is

(A) 0.8 atm (B) 0.9 atm (C) 1 atm (D) 0.5 atm

Answer: D

Solution: Given: Equal moles of CO and N_2

Total pressure = 1 atm

Step 1: Let moles of CO = moles of N_2 = x mol

$$\text{Total moles} = x + x = 2x \text{ mol}$$

Step 2: Calculate mole fraction of N_2

$$\text{Mole fraction of } \text{N}_2 (X_{\text{N}_2}) = x/2x = 0.5$$

Step 3: Determine partial pressure

$$\text{Partial pressure of } \text{N}_2 (P_{\text{N}_2}) = \text{Mole fraction} \times \text{Total pressure} = 0.5 \times 1 \text{ atm} = 0.5 \text{ atm}$$

24. Equal weights of CO and CH₄ are mixed together in an empty container at 300 K. The fraction of total pressure exerted by CH₄ is [2010]

- (A) $\frac{16}{17}$ (B) $\frac{7}{11}$ (C) $\frac{8}{9}$ (D) $\frac{5}{16}$

Answer:B

Solution:Given:Equal weights of CO and CH₄

Temperature = 300 K

Step 1: Let the weight of each gas = w grams

Molar mass of CO = 28 g/mol

Molar mass of CH₄ = 16 g/mol

Step 2: Calculate moles of each gas

Moles of CO = w/28

Moles of CH₄ = w/16

Step 3: Determine mole fraction of CH₄

Total moles = (w/28) + (w/16) = w(1/28 + 1/16)

Mole fraction of CH₄ (X_{CH_4}) = (w/16)/w(1/28 + 1/16) =

$$X_{CH_4} = \frac{\frac{1}{16}}{\frac{1}{16} + \frac{1}{28}} = \frac{\frac{1}{16}}{\frac{28+16}{16(28)}} = \frac{28}{44} = \frac{7}{11}$$

25. A gas (1g) at 4 bar pressure. If we add 2gm of gas B then the total pressure inside the container is 6 bar. Which of the following is true? [2018]

- (A) $M_A = 2M_B$ (B) $M_B = 2M_A$ (C) $M_A = 4M_B$ (D) $M_B = 4M_A$

Answer:D

Solution:Given:Initial: 1g of gas A at 4 bar

After adding 2g of gas B: Total pressure = 6 bar

Step 1: Let molar masses be M_A and M_B

Moles of A initially = $1/M_A$

Moles of B added = $2/M_B$

Step 2: Apply ideal gas law ($PV = nRT$)

For initial state (only A): $4V = (1/M_A)RT$

$$RT/V = 4M_A$$

After adding B:

$$6V = (1/M_A + 2/M_B)RT$$

Substitute RT/V : $6 = (1/M_A + 2/M_B)(4M_A)$

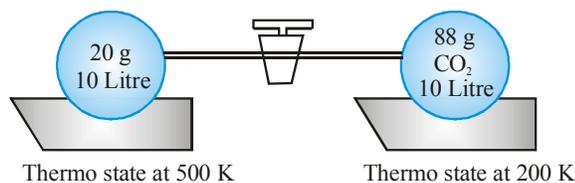

$$6 = 4 + 8(M_A/M_B)$$

$$2 = 8(M_A/M_B)$$

$$M_A/M_B = 1/4$$

$$M_B = 4M_A$$

26. Flask A of volume 10 litre containing 20 gram of H_2 and flask B of volume 10 litre containing 88 gram of CO_2 are connected by a connector having negligible volume. When valve of the connector is opened what is the composition of H_2 gas in the flask B after opening the valve.

(A) 10%

(B) 13%

(C) 15%

(D) 20%

Answer:D

Solution:Given:

Flask A: 10 L volume, contains 20 g H_2

Flask B: 10 L volume, contains 88 g CO_2

Connected via a negligible volume connector

Valve is opened, allowing gases to mix

Step 1: Calculate moles of each gas

Molar mass $H_2 = 2 \text{ g/mol}$ ----> Moles of $H_2 = 20 \text{ g} / 2 \text{ g/mol} = 10 \text{ mol}$

Molar mass $CO_2 = 44 \text{ g/mol}$ -----> Moles of $CO_2 = 88 \text{ g} / 44 \text{ g/mol} = 2 \text{ mol}$

Step 2: Determine total volume after mixing

Total volume = 10 L (Flask A) + 10 L (Flask B) = 20 L

Step 3: Calculate new concentrations after mixing

H_2 : Initially in 10 L ----> Concentration = $10 \text{ mol} / 10 \text{ L} = 1 \text{ M}$

After mixing in 20 L ----> New concentration = $10 \text{ mol} / 20 \text{ L} = 0.5 \text{ M}$

CO_2 :

Initially in 10 L -----> Concentration = $2 \text{ mol} / 10 \text{ L} = 0.2 \text{ M}$

After mixing in 20 L -----> New concentration = $2 \text{ mol} / 20 \text{ L} = 0.1 \text{ M}$

Mass Composition in Flask B

Mass of H_2 in Flask B after mixing = $5 \text{ mol} \times 2 \text{ g/mol} = 10 \text{ g}$

Mass of CO_2 in Flask B = $1 \text{ mol} \times 44 \text{ g/mol} = 44 \text{ g}$

Total mass in Flask B = $10 \text{ g} + 44 \text{ g} = 54 \text{ g}$

Mass percentage of $H_2 = (10 \text{ g} / 54 \text{ g}) \times 100 \sim 18.5\%$

27. A 40 ml of a mixture of H_2 and O_2 at 18°C and 1 atm pressure was sparked so that the formation of water was complete. The remaining pure gas had a volume of 10 ml at 18°C and 1 atm pressure. If the remaining gas was H_2 , the mole fraction of H_2 in the 40 ml mixture is :

(A) 0.75

(B) 0.5

(C) 0.65

(D) 0.85

Answer:A

Solution: Given: Total volume of H_2 and O_2 mixture = 40 mL at 18°C and 1 atm

After complete reaction to form water, remaining gas volume = 10 mL at same conditions

Remaining gas is H_2

Objective: Find the mole fraction of H_2 in the original mixture.

The reaction between H_2 and O_2 to form water is: $2H_2 + O_2 \rightarrow 2H_2O$

2 volumes of H_2 react with 1 volume of O_2 to form water (since volume \propto moles)

at constant T & P).

$$V_{H_2} = 2x, V_{O_2} = x$$

$$V_{\text{total}} = V_{H_2} + V_{O_2} = 40 \text{ ml}$$

$$V_{H_2} = 40 - x$$

Substitute into the excess H_2 equation: $(40 - x) - 2x = 10$

$$x = 10$$

$V_{O_2} = 10 \text{ mL}$ (reacted fully)

$V_{H_2} = 40 - 10 = 30 \text{ mL}$ (original H_2)

Mole fraction of $H_2 = 30/40 = 0.75$

JEE ADVANCED LEVEL QUESTIONS

Multi Correct Answer Type

1. Dalton's law of partial pressure is not applicable to the following mixture of gases

Answer: B

Solution: Dalton's Law of Partial Pressures states that the total pressure exerted by a mixture of non-reacting gases is equal to the sum of the partial pressures of individual gases. It is not applicable when gases react chemically or undergo association/dissociation.

NH_3 (ammonia) and HCl (hydrogen chloride) react immediately to form solid NH_4Cl (ammonium chloride).

Dalton's law is NOT applicable.

2. The correct mathematical equations for Graham's law are at constant temperature and pressure

A. $\frac{r_1}{r_2} = \sqrt{\frac{M_1}{M_2}}$

B. $r \propto \frac{1}{\sqrt{VD}}$

C. $\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$

D. $\frac{r_1}{r_2} = \sqrt{\frac{d_2}{d_1}}$

Answer: B, C, D

Solution: Graham's Law of Diffusion/Effusion states: $\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}} = \sqrt{\frac{d_2}{d_1}}$

Statement Type

3. Assertion : The diffusion rate of oxygen is smaller than that of nitrogen under identical conditions

Reason : Molecular mass of nitrogen is smaller than that of oxygen.

Answer:A

Solution:Assertion (True):

From Graham's Law, $r \propto \frac{1}{\sqrt{M}}$

Oxygen ($O_2, M=32$) diffuses slower than nitrogen ($N_2, M=28$) because it is heavier.

Reason (True & Correct Explanation):

The reason correctly explains the assertion since $M_{N_2} < M_{O_2}$ leading to $r_{N_2} > r_{O_2}$

4. Assertion : Pressure exerted by a mixture of reacting gases is equal to the sum of their partial pressures.

Reason : Reacting gases react to form a new gas having pressure equal to the sum of both.

Answer:E

Solution:Assertion (False):Dalton's Law applies only to non-reacting gases.

Reason (False):The product gas's pressure depends on stoichiometry, not the sum of reactants.

5. Assertion : If H_2 and Cl_2 enclosed separately in the same vessel exert pressure of 100 and 200 mm respectively, their mixture in the same vessel at the same temperature will exert a pressure of 300 mm. **[2008]**

Reason : Dalton's law of partial pressures states that total pressure is the sum of partial pressures.

Answer:D

Solution:

This applies only if the gases are non-reacting.

But $H_2 + Cl_2 \rightarrow 2HCl$ (reacts explosively in presence of light or spark)

So Dalton's Law does not apply here, pressure won't be 300 mm.

Assertion is wrong, but reason is correct in general.

Comprehension Type

- 1) Rates of diffusion of two gases are in the reciprocal ratio of square roots of their molecular weight
- 2) Total pressure of a mixture of non reacting gases is given by the algebraic sum of their partial pressure
6. O_2 is partially atomised due to certain experimental conditions. The mixture of O_2 molecules and O atoms diffuses $\sqrt{5}$ times slower than Helium. What is the percentage atomisation of O_2 ?

- A) 50% B) 20% C) 40% D) 60%

Answer:D

Solution:

$$\frac{r_{He}}{r_{mix}} = \sqrt{5} = \sqrt{\frac{M_{mix}}{M_{He}}}$$

$$5 = \frac{M_{mix}}{4}$$

$$M_{mix} = 20 \rightarrow \text{average molecular mass}$$

$$\text{Let } \%O_2 = 1 - x, \%of O = 2x$$

$$\frac{(1-x) \times 32 + 2x \times 16}{1-x+2x} = 20$$

$$\frac{32 - 32x + 32x}{1+x} = 20$$

$$32 = 20(1+x)$$

$$1.6 = 1+x$$

$$x = 0.6$$

Percentage atomization: $0.6 \times 100 = 60\%$

7. What is the mass of water vapour in the one m^3 of air with 0.4 relative humidity at 300K?

(Aqueous tension at 300 K = 3.6 K P1)

- A) 22.12 gm B) 10.53 gm C) 4.68 gm D) 2.86 gm

Answer:B

Solution:

$$\text{Relative Humidity} = \frac{P_{H_2O}}{Aq.Tension} \Rightarrow 0.4 = \frac{P_{H_2O}}{3.6 \times 10^3}$$

$$P_{H_2O} = 1.44 \times 10^3 \text{ Pa}$$

$$PV = nRT = \frac{WRT}{M}$$

$$W = \frac{PVM}{RT} = \frac{1.44 \times 10^3 \times 1 \times 18}{8.314 \times 300} = 10.53 \text{ gm}$$

Matching Type8. **Answer:1-S,2-P,3-Q,4-S****Solution:****Column I**

- 1) Diffusion of gas
- 2) Daltons Law
- 3) Relative Humidity
- 4) Rate of diffusion

Column II

- S) Molecular mass
- P) SO_3 and O_2
- Q) $\frac{\text{Partial pressure of water in air}}{\text{Vapour pressure of water}}$
- S) Molecular mass

Integer Type

9. In what ratio by mass carbon monoxide and nitrogen should be mixed so that partial pressure exerted by each gas is same ?

Answer:1

Solution: Molar mass of CO = 28 g/mol

Molar mass of N_2 = 28 g/mol

$$\frac{m_{CO}}{28} = \frac{m_{N_2}}{28}$$

$$\frac{m_{CO}}{m_{N_2}} = \frac{1}{1}$$

10. The ratio of the ratio of diffusion of helium and methane under identical condition of pressure and temperature will be _____

Answer:2

$$\text{Solution: } \frac{r_{He}}{r_{CH_4}} = \sqrt{\frac{M_{CH_4}}{M_{He}}} = \sqrt{\frac{16}{4}} = 2$$

LARNERS TASK

CONCEPTUAL UNDERSTANDING QUESTIONS (CUQ's)

Grahams Law Of Diffusion

1. If some moles of O₂ diffuse in 18 sec and same moles of other gas diffuse in 45 sec then what is the molecular weight of the unknown gas

(A) $\frac{45^2}{18^2} \times 32$

(B) $\frac{18^2}{45^2} \times 32$

(C) $\frac{18^2}{45^2 \times 32}$

(D) $\frac{45^2}{18^2 \times 32}$

Answer:A

Solution:

$$\frac{t_{O_2}}{t_x} = \sqrt{\frac{M_{O_2}}{M_x}}$$

$$\frac{18}{45} = \sqrt{\frac{32}{M_x}}$$

$$\frac{45}{18} = \sqrt{\frac{M_x}{32}}$$

$$M_x = \left(\frac{45}{18}\right)^2 \cdot 32$$

2. The ratio of rates of diffusion of SO₂, O₂ and CH₄ is

(A) $1:\sqrt{2}:2$

(B) $1:2:4$

(C) $2:\sqrt{2}:1$

(D) $1:2:\sqrt{2}$

Answer:A

Solution:

$$r \propto \frac{1}{\sqrt{M}}$$

$$r_{SO_2} \propto \frac{1}{\sqrt{64}}$$

$$r_{O_2} \propto \frac{1}{\sqrt{32}}$$

$$r_{CH_4} \propto \frac{1}{\sqrt{16}}$$

$$r_{SO_2} : r_{O_2} : r_{CH_4} = \frac{1}{\sqrt{64}} : \frac{1}{\sqrt{32}} : \frac{1}{\sqrt{16}} = \frac{1}{8} : \frac{1}{5.66} : \frac{1}{4} = 1 : 1.41 : 2$$

$$r_{SO_2} : r_{O_2} : r_{CH_4} = 1 : \sqrt{2} : 2$$

4. 50 ml of hydrogen diffuses out through a small hole from a vessel in 20 minutes. The time needed for 40 ml of oxygen to diffuse out is
(A) 12 min (B) 64 min (C) 8 min (D) 32 min

Answer:B

Solution:

$$r \propto \frac{V}{t}$$

$$V_{H_2} = 50ml, t_{H_2} = 20 \text{ min}, V_{O_2} = 40ml$$

$$t_{O_2} = \frac{40 \times 4}{2.5} = 64 \text{ min}$$

5. The ratio of the rate of diffusion of helium and methane under identical condition of pressure and temperature will be
(A) 4 (B) 2 (C) 1 (D) 0.5

Answer:B

Solution:

$$\frac{r_{He}}{r_{CH_4}} = \sqrt{\frac{M_{CH_4}}{M_{He}}}$$

$$\frac{r_{He}}{r_{CH_4}} = \sqrt{\frac{16}{4}}$$

$$\frac{r_{He}}{r_{CH_4}} = \sqrt{4}$$

$$\frac{r_{He}}{r_{CH_4}} = \frac{2}{1}$$

6. Among N_2 , O_2 and SO_2 the gas with high rate of diffusion is

- A) O_2 B) SO_2 C) N_2 4) All are same

Answer:C

Solution: $r \propto \frac{1}{\sqrt{M}}$

Lighter gases diffuse faster. Molar masses:

$$M_{N_2} = 28 \text{ g/mol}$$

$$M_{O_2} = 32 \text{ g/mol}$$

$$M_{SO_2} = 64 \text{ g/mol}$$

N_2 is lightest \rightarrow fastest diffusion.

7. Ansil's Alaram is used to detect in mines

- A) CO_2 B) CO C) CH_4 D) $COCl_2$

Answer:C

Solution: Ansil's Alaram is used to detect CH_4 in mines

8. The gas which diffuses twice as quickly as SO_2 is

- A) CH_4 B) H_2 C) O_2 D) He

Answer:A

$$4 = \frac{64}{M_{gas}}$$

Solution: $M_{gas} = 16 \text{ g/mol}$

CH₄(methane) has =16g/mol

9. Which of the following pair of gases diffuse through a porous plug with the same rates of diffusion

- A) CO, NO
H₆ B) NO₂, CO₂ C) NH₃, PH₃ D) NO, C₂H₆

Answer:D

Solution:Gases with the same molar mass diffuse at the same rate.

CO (28 g/mol) and NO (30 g/mol) →Not same.

NO₂ (46 g/mol) and CO₂ (44 g/mol) → Not same.

NH₃ (17 g/mol) and PH₃ (34 g/mol) →Not same.

NO (30 g/mol) and C₂H₆ (30 g/mol) → Same!

10. A mixture of 3 gases X(density 0.90), Y (density 0.178) and Z (density0.42) is enclosed in a vesel at constant temperature. When the equilibrium is established the

- 1) Gas X will be at the top of the vessel
- 2) Gas Y will be at the top of the vessel
- 3) Gas Z will be at the top of the vessel
- 4) Gases will mix homogeneously through out the vessel

Answer:D

Solution:Gases mix homogeneously due to random motion, regardless of density. Density affects separation under gravity, but not diffusion in a closed vessel.

11. The ratio of rate of diffusion of carbondioxide and nitrous oxide is

- A) 2 : 1 B) 1 : 2 C) 16 : 1 D) 1 : 1

Answer:D

Solution:Molar Masses:CO₂: 12+2×16=44g/mol

N₂O: 2×14+16=44g/mol

$$\frac{r_{CO_2}}{r_{N_2O}} = \sqrt{\frac{M_{N_2O}}{M_{CO_2}}} = \sqrt{\frac{44}{44}} = 1$$

12. Which of the following diffuses slowly

- A) SO₂ B) N₂ C) O₂ D) Cl₂

Answer:D

Solution: Cl_2 has the highest molar mass, so it diffuses the slowest.

13. A bottle of perfume is opened in the corner of a large Hall of volume 1000m^3 . After some time the whole Hall smells of the perfume. The property of gases responsible for this observation is

- A) Thermal conductivity B) Viscosity C) Diffusion D) Compressibility

Answer:C

Solution: Diffusion is the process by which gas molecules spread out from an area of high concentration (perfume bottle) to low concentration (entire hall).

14. Rate of the diffusion of NO_2 is

- A) Greater than that of NO B) Less than that of NO
C) Same as that of NO D) Half of that of NO

Answer:B

Solution: From Graham's Law, the rate of diffusion (r) is inversely proportional to

the square root of molar mass (M): $r \propto \frac{1}{\sqrt{M}}$

Molar mass of $\text{NO}_2 = 46 \text{ g/mol}$

Molar mass of $\text{NO} = 30 \text{ g/mol}$

Since $M_{\text{NO}_2} > M_{\text{NO}}$, the rate of diffusion of NO_2 is less than that of NO .

15. Under identical conditions which of the following has maximum diffusion rate

- A) Cl_2 B) H_2 C) CO_2 D) O_2

Answer:B

Solution: From Graham's Law, the rate of diffusion (r) is inversely proportional to

the square root of molar mass (M): $r \propto \frac{1}{\sqrt{M}}$

H_2 ($M = 2 \text{ g/mol}$) \rightarrow Lightest \rightarrow Fastest diffusion

Cl_2 ($M = 71 \text{ g/mol}$), CO_2 ($M = 44 \text{ g/mol}$), O_2 ($M = 32 \text{ g/mol}$) \rightarrow Heavier \rightarrow Slower diffusion

16. The correct order of diffusion for the gases H_2 , N_2 , O_2 and NH_3 is

- A) $\text{H}_2 > \text{N}_2 > \text{O}_2 > \text{NH}_3$ B) $\text{NH}_3 > \text{O}_2 > \text{N}_2 > \text{H}_2$ C) $\text{H}_2 > \text{N}_2 > \text{NH}_3 > \text{O}_2$ D) $\text{H}_2 > \text{NH}_3 > \text{N}_2 > \text{O}_2$

Answer:D

over the other so that the two will mix, after some time the pressure in the vessels will become.

- A) $\frac{P}{2}$ B) $\frac{P}{4}$ C) Zero D) P

Answer:C

Solution:Initial Conditions:HCl gas: Volume = V, Pressure = P, Moles = n (using $PV=nRT$).

NH₃ gas: Volume = V, Pressure = P, Moles = n.

Chemical Reaction:

When HCl and NH₃ mix, they react completely to form solid NH₄Cl (ammonium chloride): $HCl + NH_3 \rightarrow NH_4Cl$

1 mole HCl reacts with 1 mole NH₃ to form a non-gaseous product.

After Mixing:

Total initial moles of gas = $n_{HCl} + n_{NH_3} = n + n = 2n$.

All gas molecules react completely, leaving zero moles of gas in the vessel.

Since pressure is proportional to moles of gas ($P \propto n$), the final pressure becomes zero.

21. Which gas can be Collected over water

- A) NH₃ B) N₂ C) HCl D) SO₂

Answer:B

Solution:N₂ (Nitrogen) is insoluble in water and chemically inert, making it suitable for collection over water.

Other gases listed (NH₃, HCl, SO₂) are highly soluble or reactive with water, so they cannot be collected this way.

22. The vapour pressure of a moist gas at 35 °C is 750 mm and aqueous tension at that temperature is 10mm. Then vapour pressure of the dry gas is

- A) 750mm B) 760mm C)740mm D) 720mm

Answer:C

Solution:Moist gas pressure = Pressure of dry gas + Aqueous tension (water vapor pressure).

Given: $P_{moist} = 750\text{mm}$, $P_{water} = 10\text{mm}$

Dry gas pressure = $P_{moist} - P_{water} = 750 - 10 = 740\text{mm}$

JEE MAINS LEVEL QUESTIONS

Grahams Law Of Diffusion

23. 20 l of SO_2 diffuses through a porous partition in 60 seconds. Volume of O_2 diffuse under similar conditions in 30 seconds will be :

- (A) 12.14 l (B) 14.14 l (C) 18.14 l (D) 28.14 l

Answer: B

Solution: $V_{\text{SO}_2} = 20\text{L}$, $t_{\text{SO}_2} = 60\text{sec}$ ----> $r_{\text{SO}_2} = 20/60$

$V_{\text{O}_2} = ?$, $t_{\text{SO}_2} = 30\text{sec}$ -----> $r_{\text{O}_2} = V/30$

Graham's Law of Diffusion:

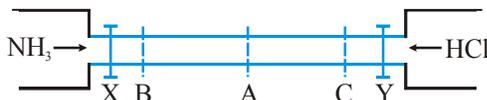

$$\frac{r_{\text{SO}_2}}{r_{\text{O}_2}} = \sqrt{\frac{M_{\text{O}_2}}{M_{\text{SO}_2}}}$$

$$\frac{20}{30} = \sqrt{\frac{32}{64}}$$

$$\frac{10}{V} = \sqrt{\frac{1}{2}}$$

$$V = 10\sqrt{2} = 10(1.414) = 14.14\text{litres}$$

24. See the figure-1 :

The valves of X and Y are opened simultaneously. The white fumes of NH_4Cl will first form at:

- (A) A (B) B (C) C (D) A, B and C simultaneously

Answer: C

Solution: White fumes appear first at C because NH_3 arrives there before HCl due to its faster diffusion.

25. X ml of H_2 gas effuses through a hole in a container in 5 sec. The time taken for the effusion of the same volume of the gas specified below under identical

conditions is :

(A) 10 sec. He (B) 20 sec. O₂ (C) 25 sec. CO₂ (D) 55 sec. CO₂

Answer:B

Solution:Graham's Law of Effusion:

The time (t) for effusion is directly proportional to the square root of the molar mass (M):

$$\frac{t_1}{t_2} = \sqrt{\frac{M_1}{M_2}}$$

$$t_{H_2} = 5 \text{ sec}, M_{H_2} = 2 \text{ g / mol}$$

(A) 10 sec. He

$$\frac{5}{t_{He}} = \sqrt{\frac{2}{4}}$$

$$t_{He} = 5(\sqrt{2}) = 7 \text{ sec}$$

(B) 20 sec. O₂

$$\frac{5}{t_{O_2}} = \sqrt{\frac{2}{32}}$$

$$t_{O_2} = 5(4) = 20 \text{ sec}$$

(C) 25 sec. CO₂ & (D) 55 sec. CO₂

$$\frac{5}{t_{CO_2}} = \sqrt{\frac{2}{44}}$$

$$t_{CO_2} = 5(\sqrt{22}) = 23.45 \text{ sec}$$

26. Three identical footballs are respectively filled with nitrogen , hydrogen and helium at same pressure. If the leaking of the gas occurs with time from the filling hole, then the ratio of the rate of leaking of gases ($r_{N_2} : r_{H_2} : r_{He}$) from three footballs under identical conditions (in equal time interval) is :

(A) $(1 : \sqrt{14} : \sqrt{7})$ (B) $(\sqrt{14} : \sqrt{7} : 1)$ (C) $(\sqrt{7} : 1 : \sqrt{14})$ (D) $(1 : \sqrt{7} : \sqrt{14})$

Answer:A

Solution:

$$r_{N_2} : r_{H_2} : r_{He} = \frac{1}{\sqrt{28}} : \frac{1}{\sqrt{2}} : \frac{1}{\sqrt{4}} = \frac{1}{2\sqrt{7}} : \frac{1}{\sqrt{2}} : \frac{1}{2}$$

$$r_{N_2} : r_{H_2} : r_{He} = \frac{1}{\sqrt{7}} : \sqrt{2} : 1 = 1 : \sqrt{14} : \sqrt{7}$$

- 27.** The rates of diffusion of SO_3 , CO_2 , PCl_3 and SO_2 are in the following order -
(A) $PCl_3 > SO_3 > SO_2 > CO_2$ **(B)** $CO_2 > SO_2 > PCl_3 > SO_3$
(C) $SO_2 > SO_3 > PCl_3 > CO_2$ **(D)** $CO_2 > SO_2 > SO_3 > PCl_3$

Answer:D

Solution:Lighter gases diffuse faster

$$M_{SO_3}=80, M_{CO_2}=44, M_{PCl_3}=137.33, M_{SO_2}=64$$

The correct order is $CO_2 > SO_2 > SO_3 > PCl_3$,

- 28.** A and B are two identical vessels. A contains 15 g ethane at 1atm and 298 K. The vessel B contains 75 g of a gas X_2 at same temperature and pressure. The vapour density of X_2 is :

- (A)** 75 **(B)** 150 **(C)** 37.5 **(D)** 45

Answer:A

Solution:Vessel A:

Mass of ethane (C_2H_6) = 15 g

Molar mass of C_2H_6 = 30 g/mol

Moles of C_2H_6 = $15/30=0.5$ moles

Vessel B:

Mass of gas X_2 = 75 g

Let molar mass of X_2 = Mg/mol

Moles of X_2 = $75/M$ mol

Since both vessels have the same volume (V), pressure (P), and temperature (T), the number of moles must be equal:

$$n_{C_2H_6} = n_{X_2}$$

$$0.5 = 75/M$$

$$M = 75/0.5 = 150g$$

Vapour density (VD) is half the molar mass: $VD = M/2 = 150/2 = 75$

Dalton's Law Of Partial Pressure

29. A sample of O_2 gas is collected over water at $23^\circ C$ at a barometric pressure of 751 mm Hg (vapour pressure of water at $23^\circ C$ is 21 mm Hg). The partial pressure of O_2 gas in the sample collected is

- (A) 21 mm Hg (B) 751 mm Hg (C) 0.96 atm (D) 1.02 atm

Answer:C

Solution: Total Pressure (Barometric Pressure): 751 mm Hg

Vapour Pressure of Water: 21 mm Hg

Partial Pressure of O_2 : $P_{O_2} = P_{total} - P = 751 - 21 = 730 \text{ mm Hg}$

Convert to atm: $730 \text{ mm Hg} \times \frac{1 \text{ atm}}{760 \text{ mm Hg}} \approx 0.96 \text{ atm}$

30. Equal weights of ethane & hydrogen are mixed in an empty container at $25^\circ C$, the fraction of the total pressure exerted by hydrogen is:

- (A) 1: 2 (B) 1: 1 (C) 1: 16 (D) 15: 16

Answer:D

Solution: Let mass of each gas = w g.

Moles of $H_2 = \frac{w}{2}$

Moles of $C_2H_6 = \frac{w}{30}$

Mole Fraction of H_2 : $X_{H_2} = \frac{\frac{w}{2}}{\frac{w}{2} + \frac{w}{30}} = \frac{\frac{w}{2}}{\frac{30w + 2w}{2(30)}} = \frac{30}{32} = \frac{15}{16}$

Partial Pressure Contribution: $P_{H_2} = X_{H_2} \times P_{total} = \frac{15}{16} P_{total}$

31. A mixture of hydrogen and oxygen at one bar pressure contains 20% by weight of hydrogen. Partial pressure of hydrogen will be

- (A) 0.2 bar (B) 0.4 bar (C) 0.6 bar (D) 0.8 bar

Answer:D

Solution: Assume 100 g of mixture:

Mass of $H_2 = 20 \text{ g} \rightarrow \text{Moles} = 20/2 = 10 \text{ mol}$

Mass of $O_2 = 80 \text{ g} \rightarrow \text{Moles} = 80/32 = 2.5 \text{ mol}$

Mole Fraction of H_2 : $X_{H_2} = \frac{10}{10+2.5} = 0.8$

Partial Pressure of H_2 : $P_{H_2} = X_{H_2} \times P_{total} = 0.8 \times 1 = 0.8 \text{ bar}$

32. A compound exists in the gaseous phase both as monomer (**A**) and dimer (A_2). The atomic mass of A is 48 and molecular mass of A_2 is 96. In an experiment 96 g of the compound was confined in a vessel of volume 33.6 litre and heated to 273°C . The pressure developed if the compound exists as dimer to the extent of 50 % by weight under these conditions will be :

- (A) 1 atm (B) 2 atm (C) 1.5 atm (D) 4 atm

Answer: B

Solution:

$$A_2 = 2A$$

$$W_A = 48 \text{ g}, W_{A_2} = 48 \text{ g}$$

$$n_A = \frac{48}{48} = 1, n_{A_2} = \frac{48}{96} = \frac{1}{2}$$

$$n_{total} = \frac{3}{2}$$

$$P = \frac{3}{2} \times \frac{0.0821 \times 546}{33.6} = 2 \text{ atm}$$

JEE ADVANCED LEVEL QUESTIONS

Multi Correct Answer Type

33. Which gas can be Collected over water

- A) NH_3 B) CO C) N_2 D) H_2

Answer: B, C, D

Solution: Analysis of Options:

NH_3 (Ammonia):

Highly soluble in water (forms NH_4OH) \rightarrow Cannot be collected over water.

CO (Carbon Monoxide): Insoluble and non-reactive \rightarrow Can be collected over water.

N_2 (Nitrogen): Insoluble and inert \rightarrow Can be collected over water.

H² (Hydrogen): Insoluble and non-reactive → Can be collected over water.

34. Dalton's law of partial pressure is not applicable to the following mixture of gases at room temperature.

Answer: D

Solution: Dalton's Law applies only to non-reacting gases.

CO + Cl₂ react at room temperature to form COCl₂ (phosgene):

Other mixtures (H₂ + N₂, H₂ + O₂, O₂ + N₂) do not react at room temperature.

Statement Type

35. Assertion : 1/4th of the gas is expelled if air present in an open vessel is heated from 27° C to 127° C.

Reason : Rate of diffusion of a gas is inversely proportional to the square root of its molecular mass.

Answer: B

Solution:

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$(\text{initial Fraction}) \frac{V_1}{V_2} = 1 \text{ when } T = 27^\circ C$$

$$\text{At } 127^\circ C \text{ the new fraction is } \frac{V_1}{V_2} = \frac{300}{400} = \frac{3}{4}$$

$$\text{air expelled} : 1 - \frac{3}{4} = \frac{1}{4}$$

Rate of diffusion of a gas is inversely proportional to the square root of its molecular mass.

36. Assertion : Effusion rate of oxygen is smaller than nitrogen.

[2004]

Reason : Molecular size of nitrogen is smaller than oxygen

Answer:C

Solution: $M_{O_2} > M_{N_2}$, So Effusion rate of oxygen is smaller than nitrogen.

Molecular size decreases from left to right along a period. Thus, molecular size of nitrogen is greater than that of oxygen.

37. Assertion : Pressure exerted by a mixture of gases is equal to the sum of their partial pressures.

Reason : Reacting gases react to form a new gas having pressure equal to the sum of both.

Answer:C

Solution: Assertion (True):

Dalton's Law states: $P_{\text{total}} = P_i$ for non-reacting gases.

Reason (False): Reacting gases do not follow Dalton's Law

Comprehension Type

Dalton's law of partial pressure states "at a given temperature, the total pressure exerted by two or more non-reacting gases occupying a definite volume is equal to the sum of the partial pressures of the component gases."

$$P_{\text{Total}} = p_1 + p_2 + p_3 + \dots \text{ (At constant V and T)}$$
$$= \left(\frac{n_1}{V} + \frac{n_2}{V} + \frac{n_3}{V} + \dots \right) RT = (n_1 + n_2 + n_3 + \dots) \frac{RT}{V} = \frac{nRT}{V}$$

Where $n = n_1 + n_2 + n_3 + \dots = \text{Total moles}$, $V = \text{Total volume}$

$$P_{\text{Total}} = \sum p_i = \frac{RT}{V} \sum n_i$$

Dalton's law of partial pressure is applicable only to non-reacting gases.

38. The partial pressure of hydrogen in a flask containing two grams of hydrogen and 32 gm of sulphur dioxide is :

- (A) 1/16th of the total pressure (B) 1/9th of the total pressure
(C) 2/3 of the total pressure (D) 1/8th of the total pressure

Answer:C

Solution:Hydrogen (H₂):Molar mass = 2 g/mol, Moles of H₂=2/2=1mol

Sulfur Dioxide (SO₂):Molar mass = 64 g/mol,Moles of SO₂ =32/64=0.5moles

$$X_{H_2} = \frac{\text{MolesOf}H_2}{\text{TotalMoles}} = \frac{1}{1+0.5} = \frac{2}{3}$$

$$\text{Partial Pressure of } H_2: P_{H_2} = X_{H_2} \times P_{total} = \frac{2}{3} P_{total}$$

Matching Type

39. Answer:2

Solution:

List -I

- A. Effusion
B. Velocity of gas
C. Pressure of the gas

List-II

1. $r \propto \frac{1}{d}$
3. Vector quantity
2. Collision of molecules on the walls
4. Scalar quantity

1. A-4, B-2, C-3 2. A-1,B-3,C-2 3. A-1,B-2,C-4 4. A-1, B-4, C-3

Integer Type

40. 3.2g of oxygen (At.wt =16) and 0.2g of hydrogen (At.wt=1) are placed in a 1.12 litre flask at 0°C. The total pressure of the gas mixture will be_____ atm

Answer:4

Solution:n_{O₂}=3.2/32=0.1 moles

n_{H₂}=0.2/2=0.1 moles

n_{total}=0.1+0.1=0.2moles

Apply Ideal Gas Law to Find Total Pressure:

PV=nRT

$$P = \frac{nRT}{V}$$

$$P = \frac{0.2 \times 0.0821 \times 273}{1.12} \approx 4 \text{ atm}$$
