

⑩ The shift produced in the path of the ray is given

⑩ by
$$d = \frac{k}{\cos r} \sin(i-r) \rightarrow (1)$$

Given $i = 60^\circ$: Refractive index of glass slab =

Thickness $k = \sqrt{3}$ cm $\mu_g = \sqrt{3}$

From Snell's law
$$\frac{\mu_g}{\mu_a} = \frac{\sin i}{\sin r}$$

$$\Rightarrow \sqrt{3} = \frac{\sin 60}{\sin r}$$

$$\Rightarrow \sqrt{3} \sin r = \frac{\sqrt{3}}{2} \Rightarrow \sin r = \frac{1}{2}$$

$$\Rightarrow r = 30^\circ$$

∴

From (1)

$$d = \frac{\sqrt{3}}{\cos 30} \sin(60-30)$$

$$= \frac{\sqrt{3}}{\frac{\sqrt{3}}{2}} \times \sin 30$$

$$\Rightarrow 2 \times \frac{1}{2} = 1 \text{ cm}$$

Frictional force always acts in a direction opposite to the motion of a body (displacement)

$$\text{ie) } \theta = 180^\circ \Rightarrow \cos 180^\circ = -1$$

$$W = f_r \cdot S \cos \theta = -ve.$$

(b)

For vertically projected body displacement of the body and force due to gravity are opposite. here also $\theta = 180^\circ$

(12)

(c)

$$\text{work done by applied force} = F \cdot S$$

$$F = -F_g = -mg \text{ [For every action on equal and opposite reaction]}$$

$$S = h$$

(13)

(a)

Work done by centripetal force = 0 because centripetal force and displacement are almost Perpendicular

$$\theta = 90^\circ$$

$$\begin{aligned} \cos 90^\circ &= 0 \quad \Rightarrow W = F_c s \cos \theta \\ &= F_c s \cos 90^\circ = 0 \end{aligned}$$

(b)

Here also Tension in the string of pendulum and displacement of pendulum are perpendicular. [$\theta = 90^\circ$]

(c)

The weight of person + load [gravitational force] and displacement of him are perpendicular [$\theta = 90^\circ$]

(14)

(a) Since frictional force always opposes motion of a body [displacement] i.e. $\theta = 180^\circ$

$$\begin{aligned} W_{\text{friction}} &= \text{friction} \times \text{displacement} \cos \theta \\ &= f s \cos 180^\circ \\ &= -fs \end{aligned}$$

(c)

$$\text{work done} = F_g s \cos \theta$$

$$= mg \sin \theta s \cos 0^\circ$$

$$= (mg \sin \theta) s$$

Here $mg \sin \theta$ & $\vec{s}$ are in same direction so $\theta = 0^\circ$

$mg \cos \theta \perp \vec{s}$ so $\theta = 90^\circ$

$$W = F_g s \cos \theta$$

$$= (mg \cos \theta) s \cos 90^\circ$$

$$= 0$$

(16)

A:- Because For one round displacement is zero

R:- Even the body is rotating centripetal force is acting

(17)

A:- If a man pushes wall due to reaction from wall, the man moves back so the angle between displacement of man and force applied by man are opposite [$\theta = 180^\circ$]

$$W = FS \cos 180^\circ = -FS = -ve.$$

(18)

(4)

We know

$$W = FS \cos \theta$$

$$W \propto \cos \theta$$

(a)

$$\theta = 0^\circ$$

$$W \propto \cos 0 \Rightarrow W \propto 1 \text{ +ve}$$

(b)

$$\theta = 180^\circ$$

$$W \propto \cos 180^\circ \Rightarrow W \propto -1 \text{ (-ve)}$$

(c)

$$\theta = 90^\circ$$

$$W \propto \cos 90^\circ \Rightarrow W = 0$$

work done by the man on suitcase depends on weight of the suitcase because work done by conservative force does not rely upon the path taken.

Also while lifting only conservative forces comes into play. so it depends on the initial and final position and the force required that in turn will be equal to weight of suitcase.

(2)

a, d are correct

(6)

As the gravitational force acts downward and the displacement of the bucket is upward, force acts opposite to the displacement of the body, the work done being a dot product of force and displacement vectors becomes negative as $\cos 180^\circ = -1$

$$W = F S \cos \theta = F S \cos 180^\circ = -FS$$
